

Gabriel Żołnierczuk

Senior iOS Engineer

Selected iOS product work · architecture ·
connected devices

13 years of native iOS development

How I work

Senior iOS Engineer building native applications since 2013. I combine hands-on product delivery with long-term ownership of architecture and engineering standards. In technical decisions, I balance the best possible user experience with sound architecture and clean, maintainable code.

13 years

commercial iOS development

Architecture

ownership since Pawscout

Connected products

Bluetooth + mobile + backend

Agentic development

Claude Code + OpenAI Codex

End-to-end ownership

I take responsibility from product and design discussions and application architecture selection through implementation, testing, integration and release readiness.

Cross-functional delivery

I work closely with product managers, designers, backend and firmware engineers, translating constraints across disciplines.

Product modernization

I plan migrations across Objective-C, Swift, UIKit and SwiftUI while keeping existing products moving.

amp · Connected strength training

A native iOS experience for an AI-powered strength-training machine. The application guides workouts, adapts resistance, communicates with the device in real time and connects the physical and digital product into one experience.

MY ROLE

Senior iOS Engineer responsible for architecture and key product areas within an approximately 20-person R&D organization. Six iOS engineers worked across three cross-functional product teams.

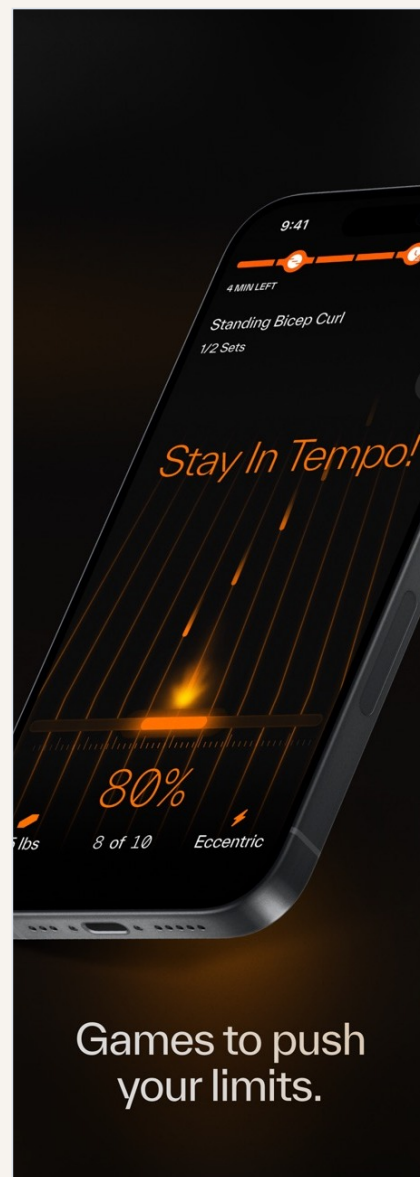

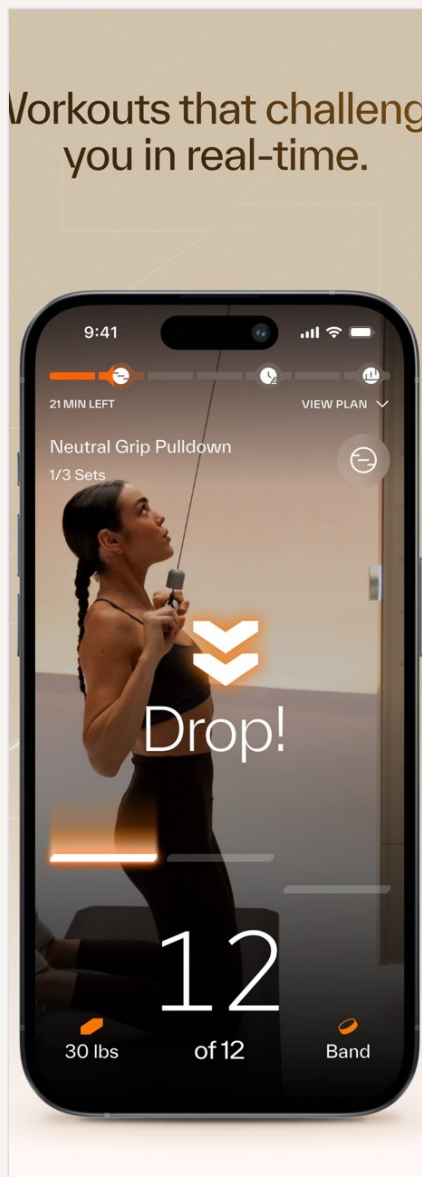

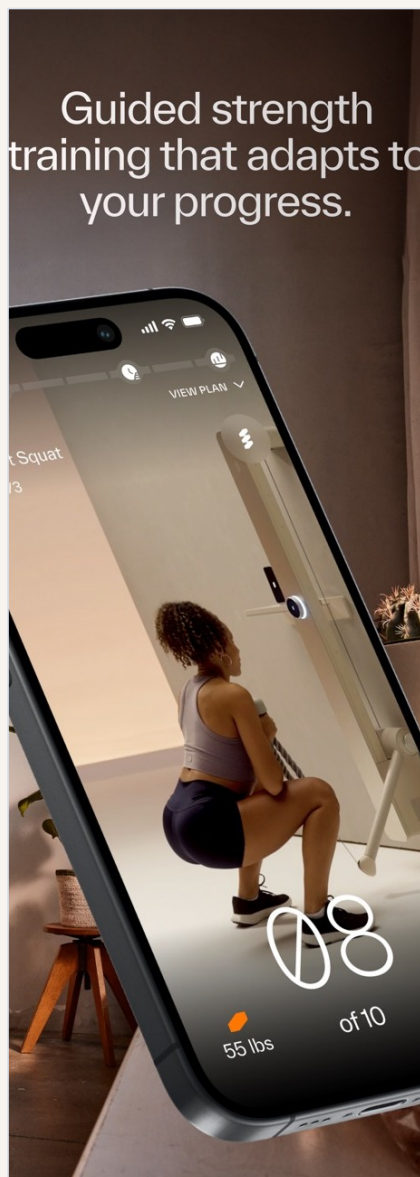

Product × mobile × hardware

Swift · SwiftUI · UIKit · GraphQL · Bluetooth / BLE

Architecture ownership

Key technical decisions, modular boundaries, technology evolution and engineering standards across a multi-team iOS organization.

Owning the core Workout experience

- 15-month end-to-end ownership of the application's most important user journey.
- Custom SwiftUI/UIKit interface for live, guided strength training.
- Real-time Bluetooth communication between iPhone and the amp machine.
- GraphQL integration for workout state, content and backend-driven behavior.
- Close collaboration with product, design, backend and firmware specialists.

Engineering beyond the feature

Application architecture

Defined modular boundaries, data flow and navigation; evaluated libraries and platform technologies.

Technology evolution

Planned the progressive adoption of SwiftUI alongside UIKit and established testing and code-review practices.

Agent-ready engineering

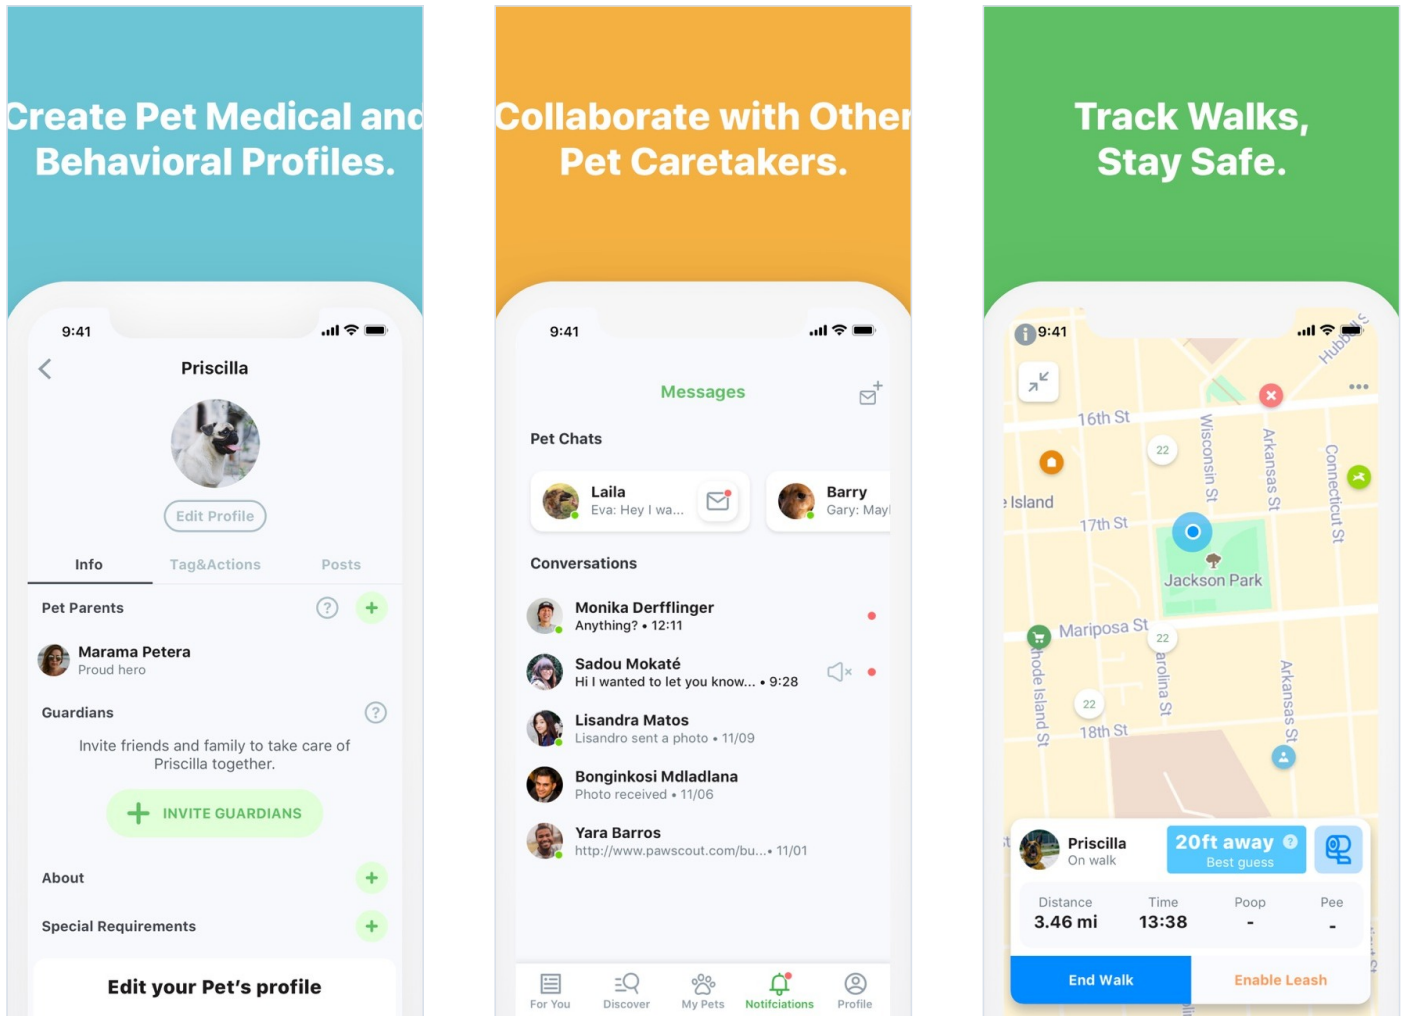

Prepared documentation, agent instructions, conventions, tests and verification workflows for Claude Code and OpenAI Codex.

Broader product contribution

Expanded into backend work during the latest five months to implement AI-powered product features and supporting service logic.

Pawscout · Mobile product + smart Bluetooth tag

A consumer pet-safety and community application paired with a Bluetooth-enabled tag. The product combined proximity tracking, walks, virtual leash functionality, pet profiles and social features.

- Started in a two-person iOS team; served as the sole iOS engineer for the final three years.
- Owned mobile architecture, technology selection, development and delivery.
- Built Bluetooth-enabled safety and proximity experiences around a physical tag.
- Planned migrations across Objective-C, Swift, UIKit and SwiftUI.
- Worked directly with backend, product and design stakeholders.

Selected products

Additional work spanning payments, social products, games, public services and Bluetooth accessories.

● Payble

iOS consulting for an Australian payments product.

● Elis

Audio-centered social application for saving and sharing thoughts and music.

● Finger Hero

Single-touch game featured in App Store 'Best New Games' in April 2016.

● Warszawa Rodzinna

Application created with the City of Warsaw to support access to public-transport discounts.

● PJWSTK

Mobile application designed for students of the Polish-Japanese Academy of Information Technology.

● BeeWi AudioLink

Bluetooth audio player for BeeWi headphones.

Let's build the next product
